SUMMARY

Product designer with 4 years designing and shipping data-heavy enterprise platforms, including billing and credit portals, fleet subsidy consoles and monitoring dashboards. As the sole designer at my company, I own each product from client requirements to production front end, designing dense tables, filters and record states knowing how they get built. I maintain the shared component library, prototype in code with AI coding agents, and build accessibility into delivery. Three platforms I designed have run in production since 2025.

EXPERIENCE

Product Designer, Gain Secure Sdn Bhd

Kuala Lumpur | Aug 2023 to Present

Sole designer in the company. Own design and front-end delivery from client requirements to production across enterprise platforms.

- Clients brought operational workflows for finance, fleet and building operations teams with no designer in the company. I worked through their requirements and system design, questioned scope where it added load without value, and turned them into user flows, wireframes, Figma storyboards and high-fidelity UI.
- Every product repeated data tables, filter panels, forms, alerts, modals and navigation. I built and maintain a shared component library with Figma variables, semantic tokens, multi-mode theming and responsive component APIs, so each new console starts from tested patterns.
- Kept design and code in step by translating designs to front end myself in Razor, ASP.NET MVC, Blazor and React, so components ship as designed.
- When my manager needed extra hands on the 7-Eleven and EcoShop warehouse systems, I took on front-end and data work inside the existing architecture, binding SQL data to Blazor components so warehouse records display live in data-driven tables and views.
- Prototyped in code early to test fidelity and catch friction before build, so issues surface in working UI instead of after handoff.
- Use AI coding agents in Codex, guided by project-specific and global skills I wrote, to turn design rules into working code prototypes and front-end-ready components, skipping static Figma mockups where a coded prototype tests the idea faster.
- Designed loading, empty, error, disabled and expiry states for record-level views, so operators read status at a glance instead of digging through totals.
- Set the accessibility bar at build: semantic HTML, full keyboard navigation and focus order, contrast, non-colour cues and reduced motion. Wrote accessibility test cases and tested with screen readers, automated checkers and contrast checkers.

UI/UX Designer, Intelliware Solutions

Remote | Apr 2022 to Jan 2023

Sole designer, working remotely with an overseas client.

- Designed a Malaysia My Second Home (MM2H) website for a Japanese client, structured around what expats need to decide rather than how the programme is administered.
- Designed a mobile app for lobster farmers, turning field operations into simple screens for users with low tolerance for complexity.

Front-End Developer, Intern, AIME Healthcare

Kuala Lumpur | Oct 2020 to Apr 2021

- Built responsive campaign websites and landing pages for SELangkah, the Selangor state COVID-19 check-in programme, from concept through deployment.

Completed alongside my diploma final year project.

SELECTED ENTERPRISE PROJECTS

VSTECS CSP Reseller Billing

Apr 2025 to Aug 2025 | In production

Monthly cloud subscription billing and credit console for VSTECS and its reseller network. Sole designer, delivered in 3 months.

- Internal ops chased overdue credit by hand. I designed an ops view that sorts every reseller account by days overdue and an account view where resellers settle specific invoices, so the team works a prioritised queue instead of reacting.
- Consolidated the Invoices and Activity tables onto one shared MVC partial view, so sorting, filtering and paging changes ship to both in a single deployment.
- Moved sign-in to email and TOTP MFA to remove stored passwords from shared finance workstations, and routed payment through FPX redirects to keep cardholder data out of the product and out of PCI scope.

FIVE Petroleum Fleet Portal, SKDS and SKPS Apr 2024 to Dec 2024 | In production

Operations portal for fleet operators in Malaysia's subsidised diesel scheme. Sole designer.

- Operators managed vehicles, drivers and points on three separate screens. I unified them behind one create, update and disable pattern, so they learn a single toolbar across all three registers.
- A total-only ledger hid subsidy about to lapse. I surfaced expiry on points, road tax and SKDS for every vehicle in three states, so operators act before value is lost.
- Capped usage per vehicle rather than per fleet, so one truck cannot drain the pooled allocation, and replaced driver deletion with a disable action to protect transaction history.

FIVE Petroleum App, Company Mode 2024 to 2025 | In production

- Designed a seven-step purchase flow that puts quota and balance before the amount field, so drivers decide with the numbers in view instead of meeting a rejection at the pump.

Daikin Indoor Air Quality Monitoring Feb 2024 to Mar 2024

- Designed a real-time monitoring dashboard 0 to 1 that turns continuous sensor readings into status building operators act on at a glance.

SELF-INITIATED

Cekap, airport guidance app for KLIA 2026

- Mapped the departure journey across nine KLIA checkpoints and designed a checkpoint-aware guidance model around the states passengers move through.
- Built UI storyboards, tested them in code, and removed a task list after testing showed it added load without changing behaviour. Case study: shafiqeffendy.xyz/cekap

Also published: a sourced landscape analysis of pain points in Malaysian e-payment apps.

SKILLS

Enterprise UX: Data tables, filter panels, complex forms, record states (loading, empty, error, disabled), dashboards, information architecture, workflow mapping, edge and failure states
Design systems: Component libraries, Figma variables, semantic tokens, multi-mode theming, component APIs, design and code parity
Prototyping and AI: Figma, FigJam, code prototypes, Codex, Claude Code, custom skills for AI coding agents
Accessibility: WCAG, keyboard navigation and focus order, screen reader testing, contrast, non-colour cues, reduced motion
Front-end: HTML, CSS, JavaScript, TypeScript, React, Razor, ASP.NET MVC, Blazor, Azure DevOps, Git, Notion

EDUCATION

Diploma in Information Technology, SEGi College Kota Damansara 2021
