SUMMARY

UI/UX designer with four years of experience designing enterprise web portals and mobile applications in petroleum, IT distribution, event technology and building services. Sole designer at Gain Secure, translating requirements from managers into high-fidelity UI and working closely with engineers to deliver it as designed. Designed two web portals and one mobile application now in production. Self-initiated projects outside work apply the full UX process, from research and design systems to coded prototypes.

EXPERIENCE

UX Designer **Aug 2023 to Present**

Gain Secure Sdn Bhd, Kuala Lumpur

- Joined as the sole designer in a company with no design function, and now design the UI for client web portals and mobile applications across four industries.
- Requirements typically come verbally from managers. Align with them on scope and expected behaviour, then translate them into wireframes, prototypes and high-fidelity UI, including error and empty states, and support engineers through front-end implementation.
- With several client products running in parallel, built a shared Figma component library using variables, semantic tokens and multi-mode theming, giving every product consistent type, colour and spacing.

Key projects at Gain Secure

VSTECS CSP Reseller Billing

Web portal for monthly cloud subscription billing across VSTECS and its reseller network. Shipped Aug 2025, in production.

- Finance staff were chasing overdue reseller credit manually. Designed an account view where resellers settle specific invoices themselves, and an internal list sorting every account by days overdue, replacing manual follow-up with self-service payment.

FIVE Petroleum Fleet Portal, SKDS and SKPS

Web portal for fleet operators in Malaysia's subsidised diesel scheme. Shipped Dec 2024, in production.

- Operators managed vehicles, drivers and points across three separate screens. Designed a single create, update and disable pattern for all three, reducing the interface to one shared toolbar.
- Subsidy lapses when points, road tax or SKDS expire unnoticed. Designed three-state expiry indicators on every vehicle so operators can act on renewals before they lapse.

FIVE Petroleum App, Company Mode

Mobile application for fleet drivers buying subsidised diesel against a company quota. In production.

- Designed the screens for a seven-step purchase journey, from vehicle selection and verification through quota check and payment to authorisation and digital invoice.
- Drivers were being rejected at the pump for exceeding quota. Moved quota, balance and company details above the amount field so drivers see their limit before paying.
- Some stations authorise purchases at the counter. Designed a second payment path in which the cashier enters station credentials on the driver's device.

Daikin Indoor Air Quality Monitoring

Real-time indoor air quality monitoring dashboard for building operators.

- Designed the monitoring dashboard from the ground up, turning continuous sensor readings into status indicators building operators can read at a glance.

Konfx Event Applications

Management, operations and consumer event applications. Under NDA.

- Assisted with the UI revamp across the management, operations and consumer applications, working within the existing architecture and business logic.

UI/UX Designer **Apr 2022 to Jan 2023**

Intelliware Solutions, Remote

- Sole designer for an overseas client, working across language and time-zone differences. Designed a Japanese-language Malaysia My Second Home (MM2H) website for prospective Japanese applicants.
- Designed a mobile application for lobster farmers to record field operations, with simple screens suited to quick use on site.

Front-End Developer Intern **Oct 2020 to Apr 2021**

AIME Healthcare, Kuala Lumpur

- Built campaign websites and landing pages for SELangkah, Selangor's COVID-19 check-in programme, from concept to deployment.
- Worked with the product team to ship features across web and mobile products.

PROJECTS

Self-initiated work outside Gain Secure, applying the full UX process, from research to design systems and coded prototypes.

Cekap, airport guidance mobile application for KLIA

Self-initiated case study, May 2026 to present. shafiqeffendy.xyz/cekap

- Travellers at KLIA are often unsure of their next step between leaving home and boarding. Mapped the departure journey across nine checkpoints and designed a guidance model around a state machine with three notification levels.
- Testing showed the geofence-driven task list added effort without changing behaviour. Removed it while keeping the underlying state machine intact.
- Built the full Figma prototype with interaction wiring and developer guide annotations, then translated it into a coded live demo.
- Supported the case study with sourced secondary research, removing any claim the evidence did not support.

Goshi Design System

Self-initiated design system for web portals, mobile applications and devices, in Figma and code. In progress.

- To serve very different products from one system, building a design system for enterprise web portals (Next.js), consumer mobile applications (Expo and React) and HHT, home appliance and kiosk interfaces (Flutter).
- Built the complete foundation layer: colour palette, type sets, semantic colour sets, radius, spacing, breakpoints, motion and duration, and sizing.
- Added skeleton, status and slot utilities to every component, preparing the system for its next phase of building components into patterns.
- Wrote every specification to be read by both people and coding agents through Global Skills, keeping implementation consistent across every product.

SKILLS

Visual and UI: High-fidelity UI, visual hierarchy, typography, colour, layout, responsive design

UX: User flows, wireframing, interactive prototyping, error and empty states, UX writing

Design systems: Component libraries, Figma variables, semantic tokens, multi-mode theming

Research: Journey mapping, heuristic review, usability testing, secondary research

Accessibility: Colour contrast, touch targets, non-colour validation cues

Front-end: HTML, CSS, JavaScript

AI tools: ChatGPT Codex, Claude Code, LLM Skills, MCP (Model Context Protocol)

Tools: Figma, FigJam, Notion, Azure DevOps, GitHub

EDUCATION

Diploma in Information Technology **2021**

SEGi College Kota Damansara
